

SOLA6 OPERATION INFORMATION

Please note the following regarding the SOLA6.

- a. The fan may not start instantly. It depends on the time it takes for the lamp to fully warm. It can take up to 10 minutes for the fan to engage, although the majority of the time the fan will spin within 5 minutes when using with a 1000w lamp.
- b. When using a 600w or 750w lamp you can achieve a quicker fan start and stronger performance by adding a Hydrofarm mogul adaptor.
- c. If the kit does not work with your 750w and 600w lamp, please note that our research shows it works with majority of available brands but may have compatibility issues with some lamps. If you have this problem, try to switching to a different lamp brand. If the lamp is old and cannot provide enough lumens to drive the fan, change to a new lamp.
- d. Please note that this kit was developed for 600-1000w lamps. If you are interested in running a 250 or 400w lamps, you must find other cooling options.
